

Jan 2020 CSE 314: Operating Systems Sessional

Online on Shell Script

Some friends want to have a tour. They have some preferred places to go to. But almost all the places are visited by some of them. So they want to find the least visited place. Help them to find it.

Input:

friends.txt: Name of the friends who want to go to the tour (one name per line)

places.txt: Name of the places they want to go (one place per line)

visited.csv: Against the name of each friend, there will be a list of places he visited

Output:

Print the count of friends against each place who have visited that place in an output file and the name of the place with the lowest number of visitors

See the sample IO files for clarification
